

# The RBL Checker for DNS Blacklisting

*(Mail Hosting: NTT Communications (Thailand) Co., Ltd.)*

When you receive an email from another email address, NTTCT Mail Hosting email servers run a RBL checker on the receiving email against any known DNS Blacklisting companies.

## What is RBL?

**RBL is Real-Time Black List or also called, a DNS-based Black-hole List (DNSBL), or Blacklist.**

Companies like Spam-cop maintain a database of IP addresses that are reported by consumers as being spam originators. When the server scans an email and finds the sender to be on a blacklist the email bounces to the sender.

## Why does NTTCT Mail Hosting use RBL checker?

Using DNS Blacklisting companies is an industry standard. Not only does NTTCT Mail Hosting uses DNS Blacklists but, most email servers in the World use them.

The DNS Blacklist Company will keep a list of known IP addresses that have been reported and verified and sending spam from the server. This forces companies to regulate their servers to prevent hacks and malicious activity from happening on their server.

If you have any questions or concern ...

**Please take note of any error messages and contact support-mail team as soon as possible.**
